Introduction

Early records of Chamba's ornithology come from papers by Marshall (1884), and Littledale (1898). The latter recorded the Eurasian Woodcock *Scolopax rusticola* in June while camping at Hul c. 25 km above Chamba. He had also recorded the nesting of Eurasian Griffon *Gyps fulvus*. Both, Marshall, and Littledale recorded a number of game birds in Chamba: Cheer Pheasant *Catreus wallichii* (Vulnerable; IUCN 2009), Western Tragopan *Tragopan melanocephalus* (Vulnerable; IUCN 2009), Himalayan Monal *Lophophorus impejanus*, Koklass *Pucrasia macrolopha*, Kalij Pheasant *Lophura leucomelanos*, and Chukar *Alectoris chukar*. More recently, Tak (1987) recorded five individuals of Western Tragopan on 19 September 1987 in Saho-Sara Reserve Forest (2,425–3,100 m; Fig. 1) lying 30 km north-east of Chamba town. Marshall's (1884) list includes c. 260 taxa from Chamba. Mahabal (1993) listed 98 species of birds from Chamba district during a monsoon survey (July 1990) based on the altitudinal distribution of birds from Sultanpur, Chamba town, Chaned, Sahoo, Ranikhet, Dalhousie, Bharmour, Hadsar, Dhancho, and Mani Mahesh (Fig. 1), areas lying mainly along the Ravi River catchment. The list included unique sightings of White-rumped Vulture *G. bengalensis* (Critically Endangered; IUCN 2009), Black-billed Magpie *Pica pica*, and White-winged Redstart *Phoenicurus erythrogaster*. Later, Thakur *et al.*, (2002) surveyed the birds of Kalatop-Khajjiar Wildlife Sanctuary (20.69 km²; 1,185–2,768 m alt.) located in the south-western part of the district, twice, during September 2001, and May 2002, and listed 66 species including Cinereous Vulture *Aegypius monachus* (Near-threatened; IUCN 2009), and White-cheeked Nuthatch *Sitta leucopsis*. Saikia *et al.* (2008) made preliminary observations on the avifauna of Pangi valley, in the northern part of Chamba district (Fig. 1), along the Chandrabhaga River, located in the north-western part of the district, and listed 62 species including the uncommon Orange Bullfinch *Pyrrhula aurantiaca*, a species endemic to the Western Himalayas. In addition there are some more records of pheasants from Chamba district (Jandrotia *et al.* 1995; Katoch *et al.* 1997; Bashir 2000; Kaul *et al.* 2001).

Study area

Chamba district of Himachal Pradesh (HP) state, India, (32°11'30"–33°13'6"N, 75°49'–77°3'30"E) is surrounded by Jammu & Kashmir state on its north-west, Lahaul and Spiti district (HP) on its north-east and east, Kangra district (HP) on its south and south-east, and Gurdaspur district (Punjab) on its south-west (Fig. 1). It covers an area of c. 6,528 km² (11.72% of HP). The entire district has catchments of two major rivers. The

Ravi River flows east–west in the Punjab, covering nearly two-thirds of the district. Chandrabhaga (Chenab) River also flows east–west into Jammu & Kashmir, but in the northern part of this district. The climate is sub-tropical to sub-arctic. The mean annual rainfall in the district is c. 1,485 mm (Mahabal 1993), which falls mainly during the monsoon, and winter, when most of the higher reaches remain under snow cover.

As per Champion & Seth (1968) the vegetation in the area is mainly 'Moist Deodar Forest 12/C1(c)'; 'Western Mixed Coniferous Forest 12/C1 (d)' interspersed with 'Alpine Pastures 15/C3' at higher elevations. deodar *Cedrus deodara* and blue pine *Pinus wallichiana* are dominating tree species that occur intermixed with horse chestnut *Aesculus indica*, rhododendron *Rhododendron arboreum*, oak *Quercus ilex*, *Pyrus* sp., walnut *Juglans regia*, etc. The shrub layer comprises *Berberis aristata*, *Prinsepia utilis*, *Rosa moschata*, *Rubus* sp., *Daphane* sp., *Cannabis sativa*, etc. Further up these conifer species are replaced by Himalayan silver fir *Abies pindrow* and yew *Taxus baccata* that are more common. Stands of *Alnus nitida* dominate the eroded riverbanks of Ravi in this area.

The environmental parameters recorded during the study period are presented below. The weather during May was dry, while it was wet during September and the area received winter rains and snow during February.

Methodology

An ornithological survey was conducted along the upper Ravi River, between coordinates 32°18.15'N–32°27.94'N, 76°31.85'E–76°39.00'E, at an altitudinal gradient between 1,730–2,700 m during three seasons: summer (14–17 May 2008), late monsoon (11–14 September 2008), and peak winter (5–8 February 2009). The survey area included villages: Kuther-Batola-Holi-Deol-Nayagaon (up to Ilake-wali-mata temple where the road ends), and adjoining mountain slopes located on the left bank of Ravi River. This area lies in the south-eastern part of Chamba district, south of Mani Mahesh and Kukti Wildlife Sanctuary and north of the Dhauladhar Range, which runs parallel to Ravi River.

Environmental parameters	14–17 May 2008	11–14 September 2008	5–8 February 2009
Relative humidity (%) (day)	47.0–61.7	58.1–67.7	51.0–94.2
Temperature (°C) (day)	20.5–27.4	21.7–27.0	3.0–11.1
Wind speed (m/s) (day)	0.3–0.4	0.4–0.8	0.4–6.4

Fig. 1. Map of Chamba district depicting the study area and locations of sites as mentioned in the text.

Results & Discussion

A total of 103 species (see Appendix) were recorded during the study of which 47 spp., are common with Mahabal (1993); 43 spp., are common with Thakur *et al.* (2002), and 40 spp., with Saikia *et al.* (2008). Whereas, 16 spp., marked with an asterisk in the Appendix, have not been reported by the earlier authors from Chamba district. Numbers of species observed were highest during May (63), followed by September (54), and were the least in February (43).

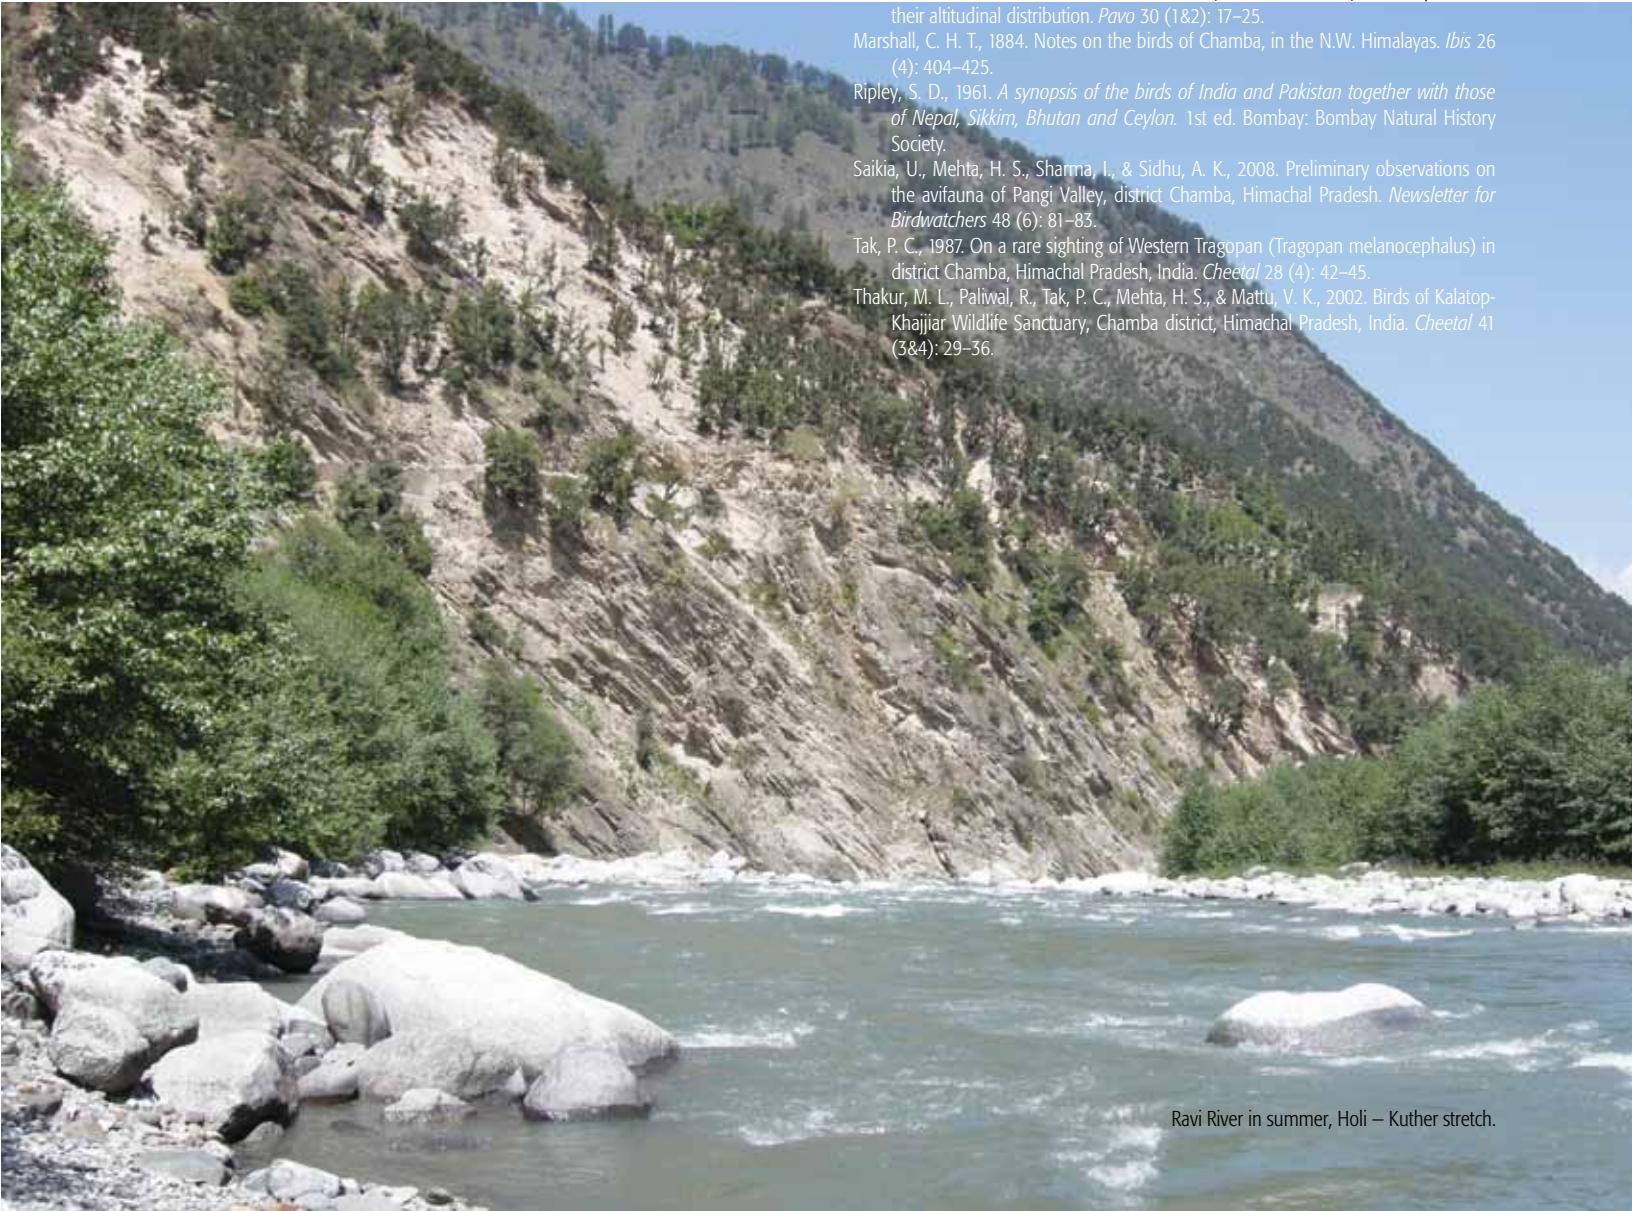

Of these 16 new records for the district, seven are worth mentioning as they were recorded at the western-most limits of their distribution range in the Himalayas. These species were Nepal Wren Babbler, *Pnoepyga immaculata*, Chestnut-tailed Minla *Minla strigula*, Rufous-gorgeted Flycatcher *Ficedula strophiata*, Yellow-bellied Fantail *Rhipidura hypoxantha*, Chestnut-headed Tesia *Tesia castaneocoronata*, Ashy-throated Warbler *Phylloscopus maculipennis*, and Upland Pipit *Anthus sylvanus*.

The record of Nepal Wren Babbler is a range extension as there are very few records of this species from Himachal Pradesh and none from Chamba district. It was observed at Holi and Deol villages in 'nullahs' along the streamlets leading into the Ravi River and was identified by its high a rapidly uttered vocal

note, 'ti-ti-ti-ti-ti-ti-ti-ti,' descending slightly in tone (Kazmierczak 2000). The annotated checklist for Chamba district now touches 289 species.
